SETAC North America 46th Annual Meeting Session 2.09.T—Large River Monitoring: Programs, Design, Methods and Interpretations

Thursday, November 20, 2025

.....

Portland Harbor Baseline Ecological Risk Assessment

- Great example of ecological risk assessment for large river sites
- One small piece: analyzing uncertainty in sediment toxicity test findings

Portland Harbor Baseline Ecological Risk Assessment

Also of interest

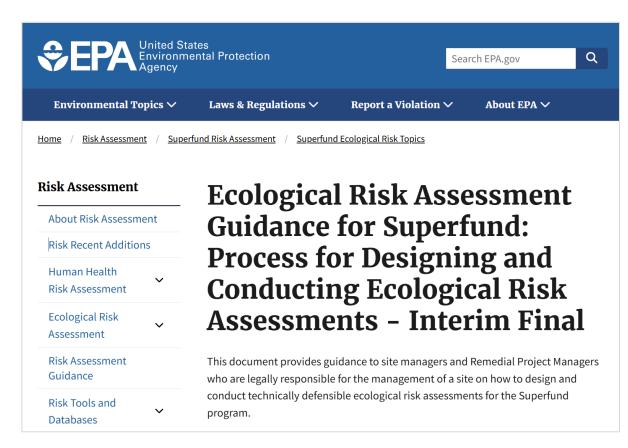

Luxon, Toll and Hanson. 2013. Assessing Effects of PCB Exposure on American Mink (*Mustela vison*) Abundance in Portland Harbor. IEAM 10(1):20-68.

Overview of the process

Iterative approach to ecological risk assessment (EPA, 1997)

- 1. Screening-level problem formulation and ecological effects evaluation
- 2. Screening-level preliminary exposure estimate and risk calculation
- 3. Baseline risk assessment problem formulation
- 4. Study design and data quality objectives
- 5. Field verification of sampling design
- 6. Site investigation and analysis of exposure and effects
- 7. Risk characterization
- 8. Risk management

https://semspub.epa.gov/work/HQ/157941.pdf

Overview of the process

- No guidance document can describe procedures to fully evaluate ecological risks at sites as complex as Portland Harbor
- Numerous site-specific procedures, methodologies, memoranda, and intermediate data reports and analyses have been developed and presented in documents prepared by the Lower Willamette Group, in collaboration with and under the oversight of EPA and federal, state, and tribal partners
- My goals for today:
 - Pique your interest
 - Make you aware of available resources
 - Let you know I'm eager to help

Invertebrate sediment toxicity assessment

......

- Two predictive benthic toxicity models selected after extensive consultation with EPA and others
 - Floating percentile model (FPM) (Regional Sediment Evaluation Team 2009)*
 - Logistic regression model (LRM) (Field et al., 1999)
- FPM and LRM used to develop site-specific sediment quality values (SQVs)
 - Identified chemicals most associated with sediment toxicity
 - For each chemical, developed a site-specific
 SQV to predict sediment toxicity to benthic
 organisms with an estimated degree of reliability

*The RSET Sediment Evaluation Framework was updated in 2016 and published in May 2018

Floating percentile model

.....

- Original software a "black box"
 - Limited user control
 - Locked access to the tool's underlying code
 - Not readily available
- Our package implements the FPM in R
 - Expanded user controls
 - Open code
 - Readily available for public use and evaluation

Mr. Bob Wyatt Northwest Natural & Co-Chairman, Lower Willamette Group 220 Northwest Second Avenue Portland, OR 97209

Re: Portland Harbor Superfund Site; Administrative Order on Consent for Remedial

Investigation and Feasibility Study; Docket No. CERCLA-10-2001-0240

EPA Comments on Benthic Risk Evaluation

The data and how they were used

.....

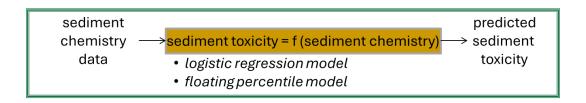

Test and endpoint	REV (%)	0.90*REV	0.80*REV
C. dilutus survival	93.9	84.5	75.1
C. dilutus biomass	91.0	81.9	72.8
H. azteca survival	88.1	79.3	70.5
H. azteca biomass	73.6	66.2	58.9

The data and how they were used

......

1,920 surface sediment chemistry samples-293 sediment toxicity test samples

1,627 toxicity predicted from chemistry

Negative Control-adjusted Biomass or Survival (Treatment/Control)*100 (The REV in this example is for *Hyalella* survival.)

Uncertainty analysis*

- Calculates probability that each bioassay sample was assigned to the correct toxicity category
- Likelihood calculation quantified the probability that the sample's true mean response fell between the toxicity thresholds indicated by the sample mean
- Accounts for:

.....

- Variance in bioassay replicates
- Uncertainty in magnitude of mean control response

MEMORANDUM

To: Eric Blischke, US Environmental Protection Agency
From: John Toll, Lorraine Read, Nancy Musgrove, Lucinda Tear
Subject: Quantification of Uncertainty in Portland Harbor Bioassay Responses
Date: November 30, 2010

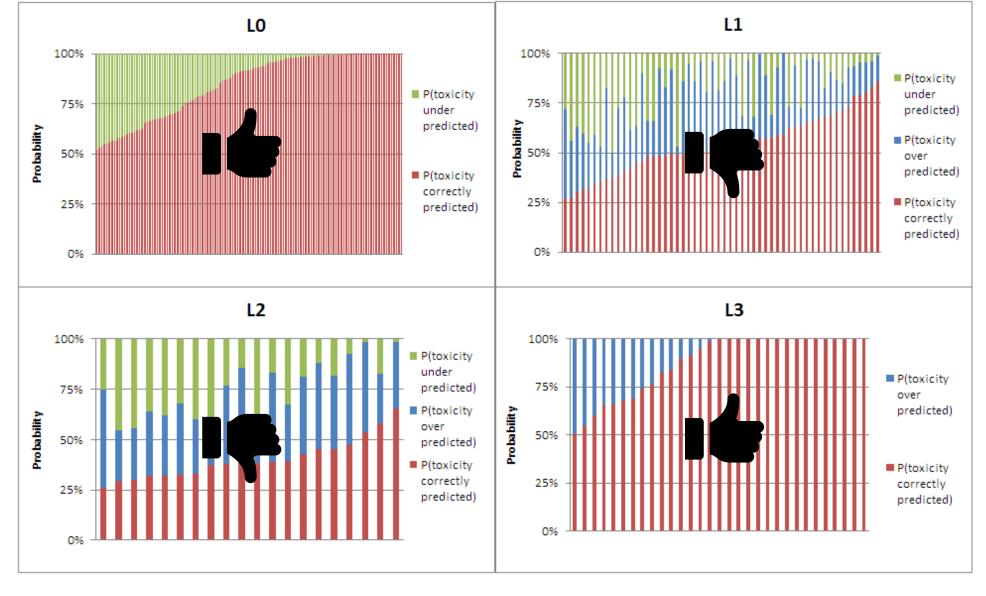

^{*}Final Remedial Investigation Report, Appendix G (BERA), Attachment 6 (Toxicity Test Results and Interpretation), Part C (Uncertainty Analysis) (pp. 119-126)

Cumulative probability distribution on true mean response for particular sample and endpoint (D1-1, *Chironomus* growth)

$$-\ln L(\mu \mid X, s^{2}) = \sum_{i=1}^{8} \ln(s\sqrt{2\pi}) + \frac{(X_{i} - \mu)^{2}}{2s^{2}}$$

- Estimate sample variance s² for eight replicates
- 2. Estimate the negative log-likelihood for each possible value of μ
- 3. Convert negative log-likelihoods to likelihoods (multiply by -1 and exponentiate)
- Divide individual likelihoods by sum of all likelihoods to convert likelihood values to a probability distribution
- 5. Treatment of uncertainty due to variance in control response: see Attachment 6, Part C, pp. 121–122

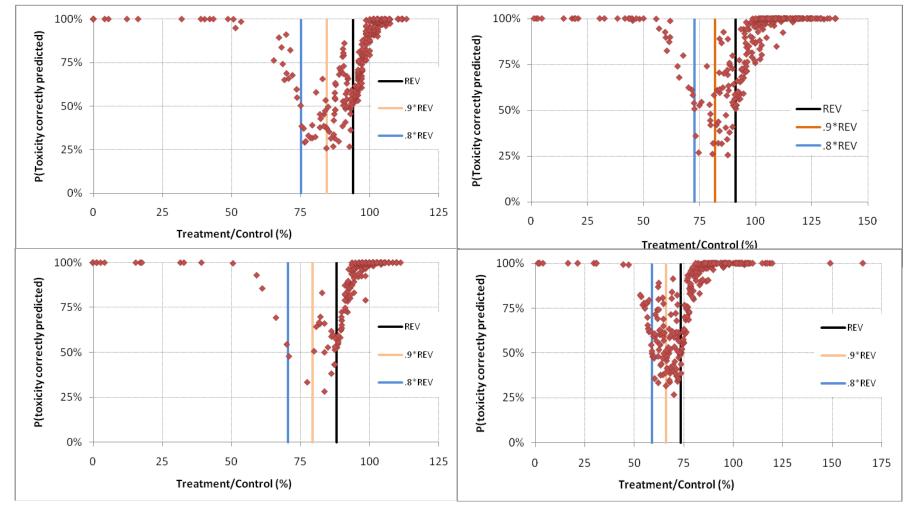

Stacked bar graphs of probabilities that toxicity is correctly predicted, underpredicted, or over-predicted based on Bayesian posterior probabilities. Each bar represents a bioassay station.

Probability of correctly predicting bioassay hit classification

......

Chironomus

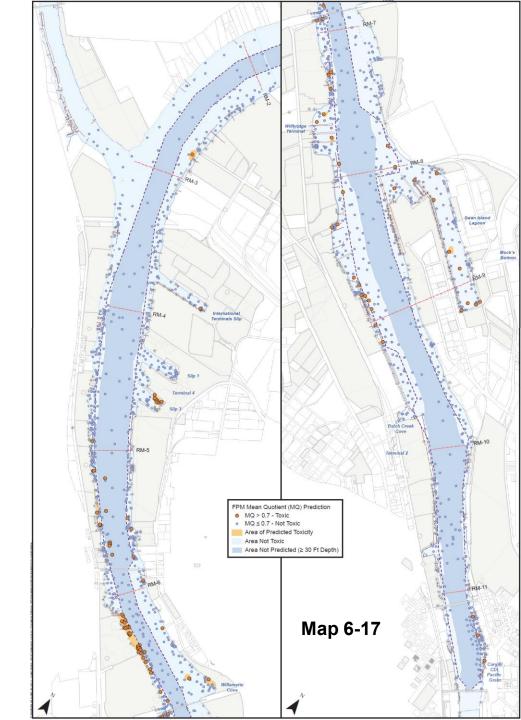

Hyalella

Summary of findings

- Understanding reliability of bioassay hit classifications influenced risk characterization methods and findings
- Multiple lines of evidence needed to support potentially unacceptable benthic risk conclusions based on L2 hits
- Potentially unacceptable benthic risks:
 - Highly associated with shoreline areas, slips, and areas of elevated sediment chemical concentrations
 - Represent appx. 7% of total study area

Conclusion

- Portland Harbor BERA: large river investigation involving at least three of the four elements of the environmental risk assessor's job
 - Advanced state of the science
 - Advanced scientific rigor of characterizing nature and extent of environmental risk associated with a site or situation
 - Uncovered facts that were difficult to discover
 - Provided trial by fire for building trust and integrity
- There's a fifth element of the environmental risk assessor's job: translating risk findings into risk management decisions
 - We built the tools to assess reliability, but we didn't do enough to translate reliability analysis into simple cleanup metrics

Thank you
